The Reality of AWS Day 2 Operations

ENVIRONMENT: Enterprise // TARGET: Operational Maturity

A Blueprint for Cloud Platform Engineering at NorthBank

NotebookLM

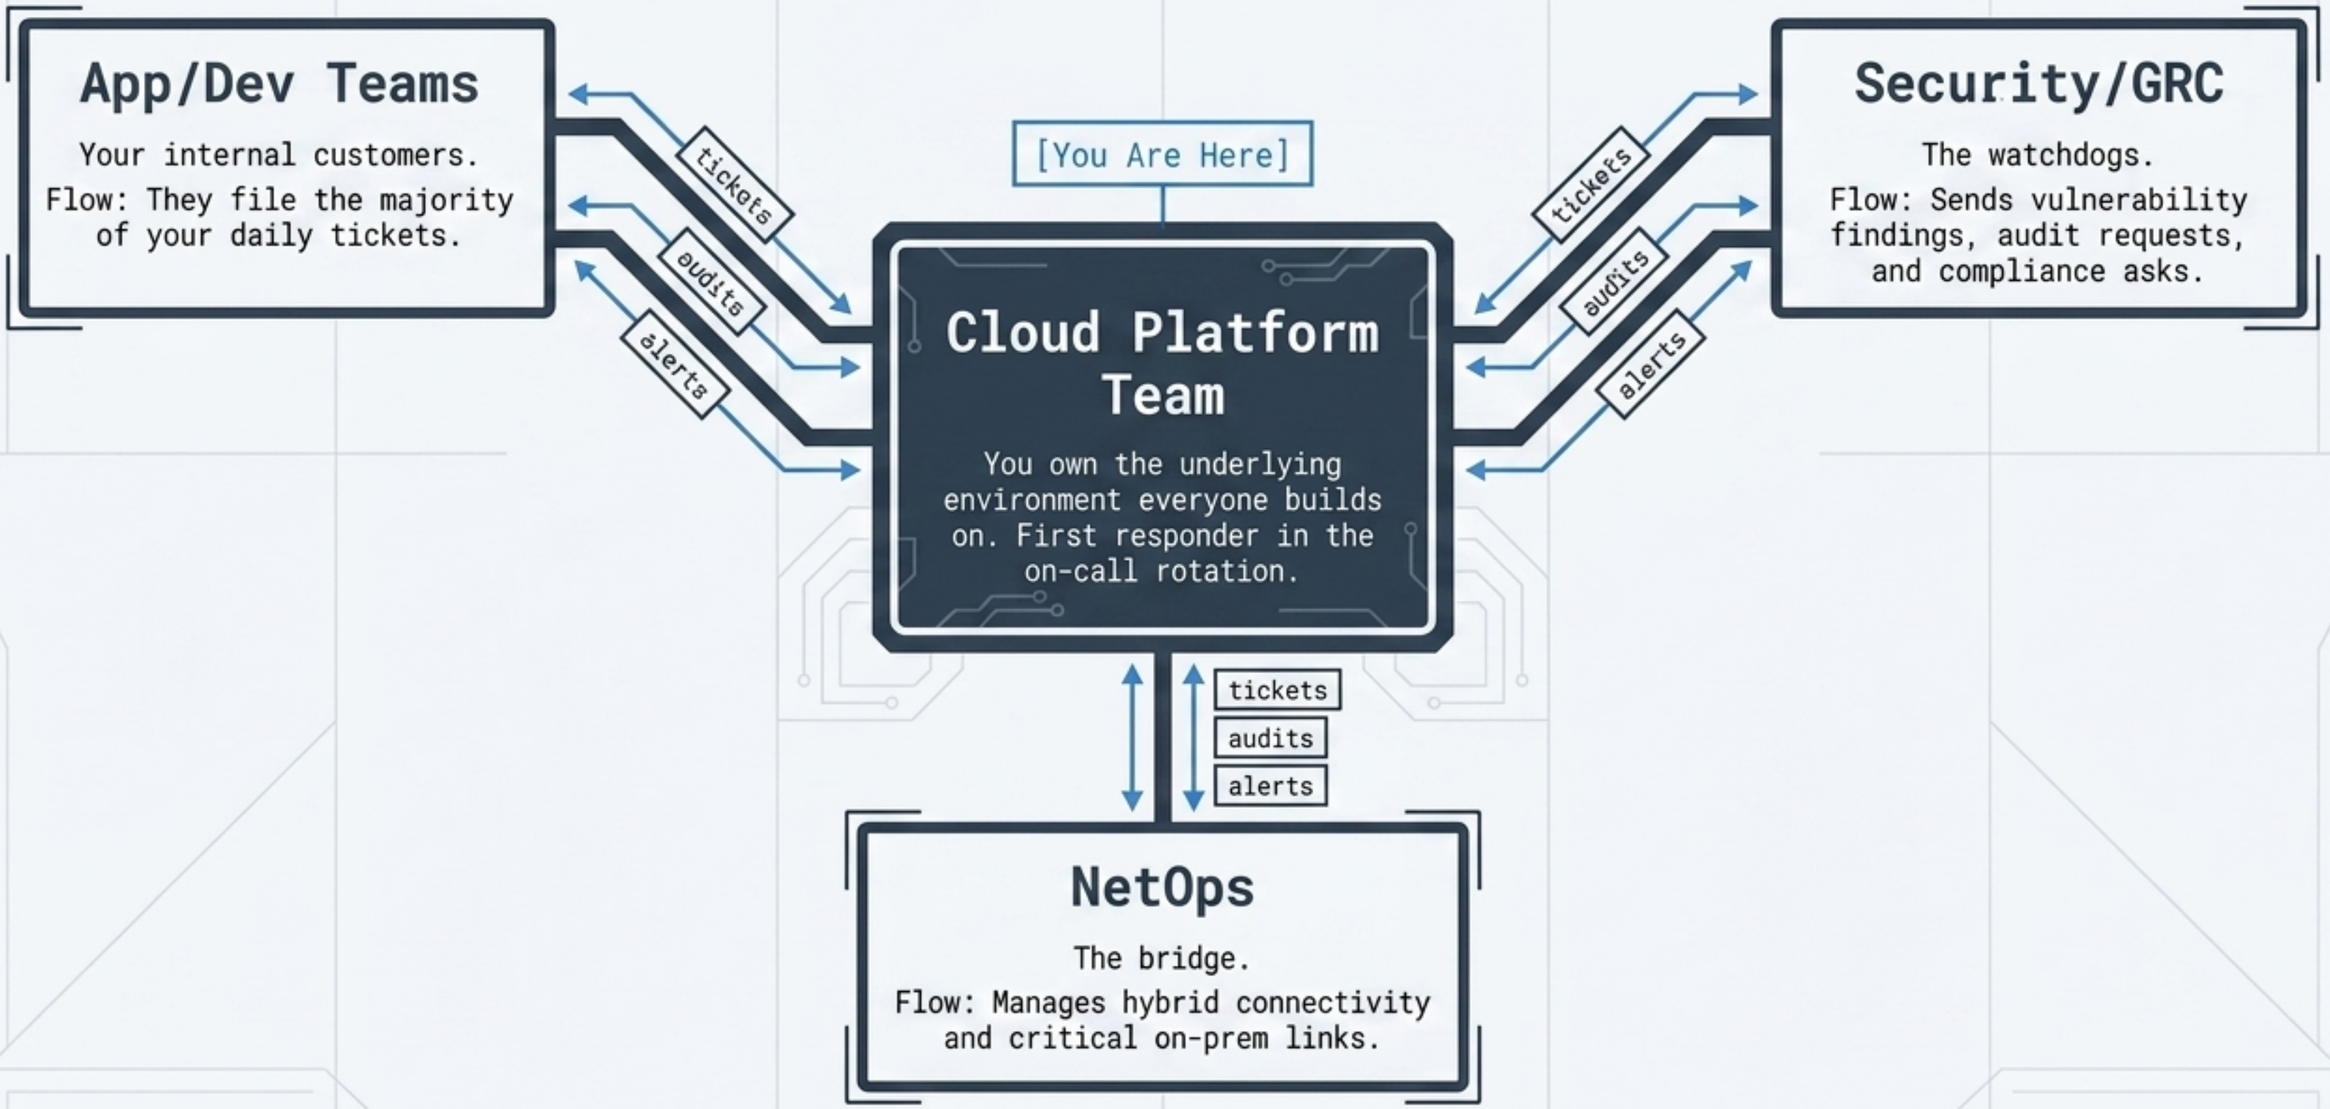

The Enterprise Baseline: Non-Negotiable Stakes

Every lab, every loop, and every ticket you touch is governed by four structural pillars at NorthBank.

The Agile Slice: Why Ops Leans Kanban

Sprints, story points, and velocity are mostly the dev teams' world. Here is how ops manages the flow.

```
> executes: daily_standup.sh
```

The one ceremony you are consistently involved in to merge planned work with overnight interrupts.

NotebookLM

Same Board, Different Altitude

Month One is not about architectural mastery; it is about operational execution. This is not a lesser job; it is the right job for your current altitude.

	Fresher	Senior
Task Scope	Highly scoped tickets, heavily documented runbook execution.	Multi-system architecture calls, strategic planning.
Incident Response	Shadowing the on-call rotation, learning the diagnostic pathways.	Leading ambiguous, high-stakes 3 AM incident bridges.
Team Value	Clearing the backlog, executing routine maintenance cleanly.	Mentoring juniors, unblocking complex engineering hurdles.

NotebookLM

The Reality of the Daily Grind

The Exciting Terminal Time

Executing commands, writing scripts, direct console interaction.

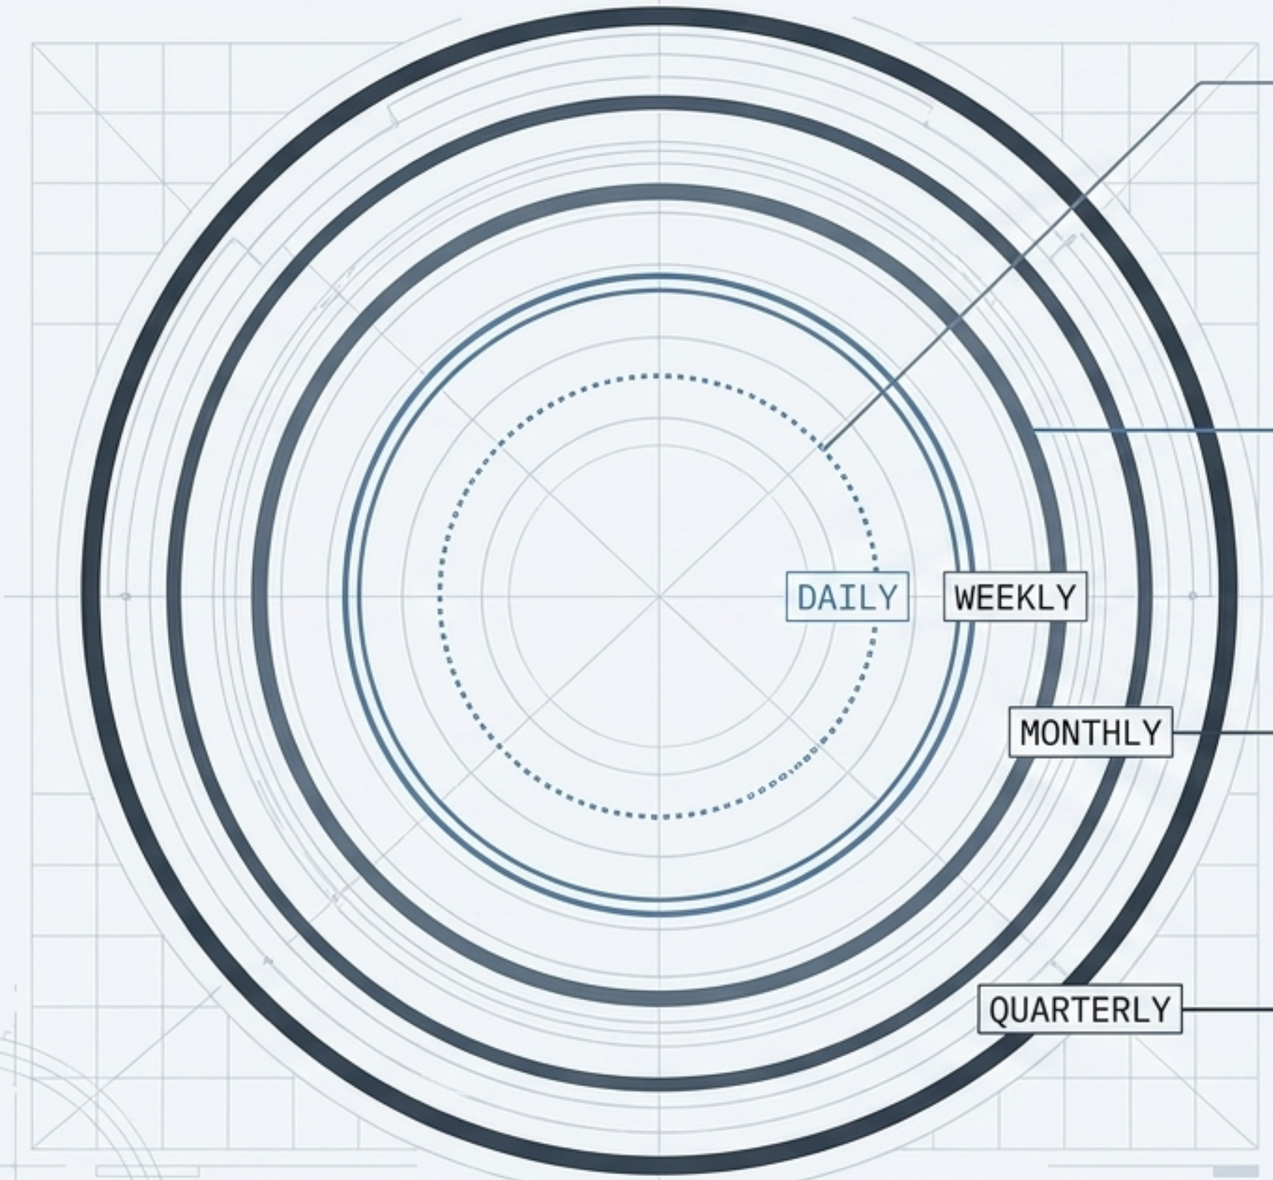

1. **Login & Context:** Checking the overnight logs, prepping for standup.
2. **Planned Execution:** Working through sprint tickets.
3. **Interrupt Handling:** Active alarms, access grants, "the app can't reach the DB".
4. **Wrap-up:** Updating tickets, writing documentation, end-of-day handoff.

System engineering is 20% keystrokes and 80% context, communication, and documentation.

NotebookLM

Operational Rhythms: The Nested Cadence

Daily Loop

Login, overnight check, standup, sprint tickets, active interrupts.

Weekly Loop

Patch review meetings, findings backlog grooming, on-call handover, initial cost checks.

Monthly Loop

Sprint reviews, deep cost analysis, access/IAM reviews, backup restore testing.

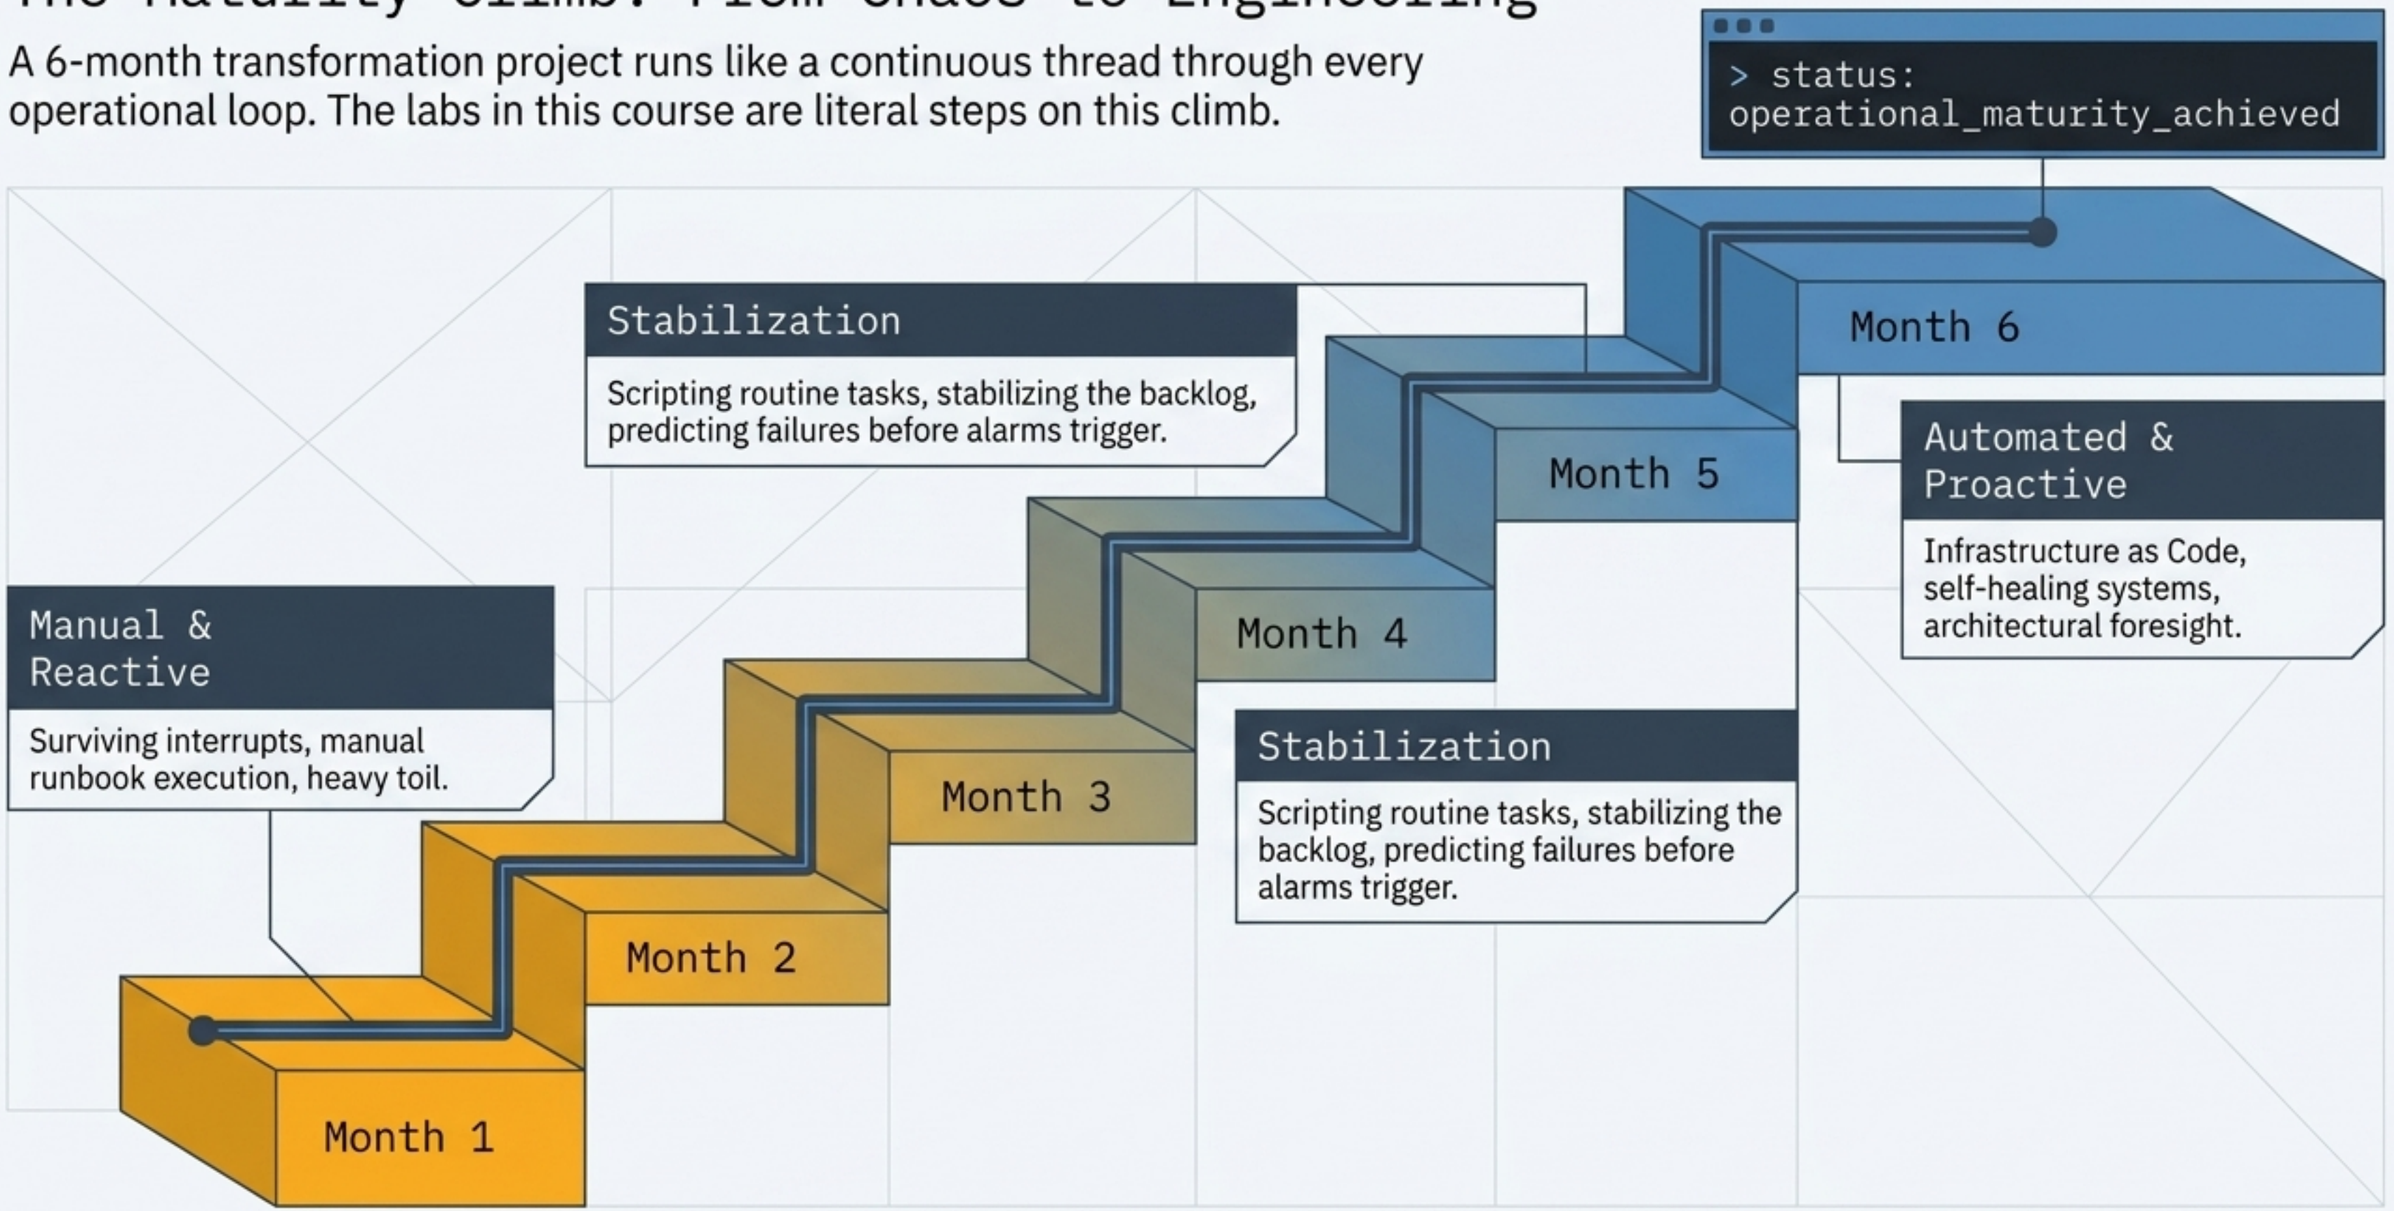

Quarterly Loop

Disaster Recovery (DR) drills, audit evidence collection, architecture reviews, budget planning.

NotebookLM

The Maturity Climb: From Chaos to Engineering

A 6-month transformation project runs like a continuous thread through every operational loop. The labs in this course are literal steps on this climb.
